Orbitly Customer Case Study Pack

Three reference accounts · FY2026 · Prepared for Meridian Freight Systems · Document ID: CS-PACK-2026-Q3 · Confidential

Case Study 1 — TransCarry Logistics

Profile. TransCarry is a pan-Asian contract-logistics operator running 1,100 sales reps across 9 countries, selling freight capacity and warehousing contracts to mid-market manufacturers. Like most logistics sellers, their pipeline lives in Salesforce while the real signals — detention disputes, lane-rate objections, seasonal capacity commitments — live on phone calls. They onboarded Orbitly SalesOS (Growth tier) in Q4-FY2025.

Problem. Forecast calls were a weekly argument: regional managers each defended a spreadsheet number, and the aggregate landed within ±15% of the actual quarter. Ramp was the second tax — new account executives needed six months to reach quota, and the same onboarding content was re-delivered manually by an enablement team of three.

What changed. After two quarters on Orbitly: forecast accuracy moved from 60% to 85% (median absolute error on the weekly commit); ramp-to-quota compressed to 3 months; manager call-review time dropped from 40 minutes per rep per week to under 2 minutes of scored highlights; and $4.2M of at-risk pipeline was pulled forward when forecast flags surfaced stalling deals eight weeks before quarter close.

$4.2M	3 mo	+12%
pipeline pulled forward	ramp to quota (was 6)	win rate after 2 quarters

ROI at Meridian-like scale

Line item	Value	Basis
Annual license (340 seats, Growth)	$204,000	$600/seat list; $173,400 with 15% three-year commit
Recovered selling time	$1.63M/yr	8.5 hrs/rep/wk saved × 340 reps × $110/hr loaded cost
Ramp acceleration value	$0.9M/yr	3 months earlier quota × ~60 new AEs/yr × $5K/mo margin
Forecast-error reduction	$0.7M/yr	±15% → ±5% error on a $48M annual number
Payback	7 months	conservative: selling-time value only

Table 1 — TransCarry ROI model, normalized to Meridian's 340-seat scale (illustrative).

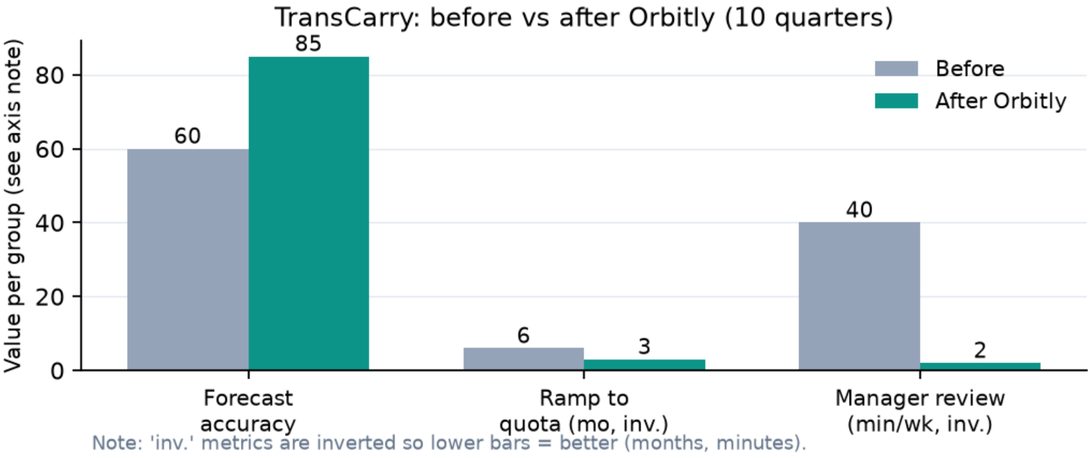

Figure 1 — Before/after on the three headline metrics. 'inv.' = inverted so lower is better.

“The Monday forecast fight is gone. The number the machine puts up is the number we actually land within five points.” — Dana Whitfield, CRO, TransCarry

Case Study 2 — Helios Medical Devices

Profile. Helios sells surgical equipment into hospital networks through a 600-rep field team with an unusually long cycle — procurement committees, compliance reviews, and an average 9-month deal. They onboarded in Q2-FY2025, Enterprise tier with EU residency.

Problem. Committee deals died silently: a single unanswered compliance objection in month five could stall a $400K opportunity without anyone noticing for a quarter. Coaching coverage was 1 manager to 14 reps, so call review was effectively a lottery.

Outcome. Orbitly's objection taxonomy surfaced stalled-committee deals 6 weeks earlier on median; win rate on deals above $250K rose from 22% to 31% over three quarters; and every rep now receives a weekly scored highlight reel, giving coaching coverage that doesn't depend on manager headcount. Security review passed with EU residency on the Enterprise tier.

Metric	Before	After 3 quarters
Win rate, deals > $250K	22%	31%
Median stall-detection lag	9 weeks	3 weeks
Coaching coverage	1:14 (manager-bound)	1:1 (automated weekly)
Committee-deal forecast accuracy	58%	86%

Table 2 — Helios Medical outcomes, FY2026 cohort review.

> *"It found the compliance objection buried on a 47-minute call in week three that we didn't find until the deal had been dead for a month." — Marcus Reinhardt, VP Sales, Helios*

Case Study 3 — Solstice Software (velocity sales)

Profile. A 90-rep inside-sales team selling developer tooling on 3-week cycles — the opposite end of the motion from TransCarry. Solstice runs Team tier plus the Conversation Intelligence add-on and validates whether the platform works at high volume rather than high deal value. They process roughly 8,000 calls per day.

Outcome. At velocity scale, the value shifts from forecasting to messaging: playbook scoring showed that reps who mentioned the customer's onboarding effort in the first 10 minutes closed 1.7× more often, so the pitch was re-ordered team-wide in week one of analysis. Objection-to-playbook mapping cut discounting from an 18% average to 11% by routing the pricing objection to a standard proof script.

Signal discovered	Action taken	Result
Early onboarding-effort mention → 1.7× close rate	Pitch re-ordered in week 1	+23% team close rate in a quarter
Pricing objection without proof script → −31% win	Auto-surfaced proof snippets to reps	Avg discount 18% → 11%
Top-decile demo structure	Extracted and templatized	New-hire ramp 5.5 → 3.5 months

Table 3 — Solstice velocity-account signals, FY2026.

Methodology note: cohort metrics are medians across customers onboarded in the stated window, measured on the Orbitly platform. Figures labeled illustrative are modeled, not audited. Full methodology and customer references are available under NDA.
